Probability Models A probability model is a mathematical representation of a random phenomenon. It is defined by its sample space, events within the sample space, and probabilities associated with each event.. The sample space S for a probability model is the set of all possible outcomes.. For example, suppose there are 5 marbles in a bowl. One is red, one is blue, one is yellow, one is green ...

The sigmoid function yields the following plot: Figure 1: Sigmoid function. If z represents the output of the linear layer of a model trained with logistic regression, then sigmoid(z) will yield a value (a probability) between 0 and 1. In mathematical terms:

Logistic Regression: Calculating a Probability

Probability is a measure quantifying the likelihood that events will occur. Probability is a number between 0 and 1, where, roughly speaking, 0 indicates impossibility and 1 indicates certainty. The higher the probability of an event, the more likely it is that the event will occur.
