Metabolic network modelling, also known as metabolic network reconstruction or metabolic pathway analysis, allows for an in-depth insight into the molecular mechanisms of a particular organism. In particular, these models correlate the genome with molecular physiology. A reconstruction breaks down metabolic pathways (such as glycolysis and the citric acid cycle) into their respective reactions ...

Molecular orbital theory predicts the electronic ground state denoted by the molecular term symbol $3 \Sigma^- g$, and two low-lying excited singlet states with term symbols $1 \Delta g$ and $1 \Sigma^+ g$. These three electronic states differ only in the spin and the occupancy of oxygen's two antibonding π^* -orbitals, which are degenerate (equal in energy).

Molecular Biology methods used to study the molecular basis of biological activity. Most commonly used methods are protein methods, immunostaining methods, nucleic acid methods. These methods used to explore cells, their characteristics, parts, and chemical processes, and pays special attention to how molecules control a cell's activities and growth.
